DEDICATION

Prof. Vishnu Shridhar Wakankar

(4th May-1919-3rd April, 1988)

An archaeologist from India, who discovered the rock caves with paintings at Bhimbetka (Madhya Pradesh), earliest habitation of humans in India, in 1957; declared as World Heritage Site by UNESCO in 2003. We dedicate this issue of Arnava Vol.VII No.1 to the memory of this legendary personality. We have also planed an edited book on Rock Art to show our heart-felt gratitude to the great scholar Prof. Vishnu Shridhar Wakankar.

Editorial

Arnava Vol. VII, No.1 Year 2018 is a bunch of different papers and articles on art, archaeology, Buddhism, economics, heritage, nature, numismatics, religion, rituals, rock art etc.; covering vast horizons with its each issue. The palaeolithic tool of Nagpur (by Dr. K. S. Chandra) and megalithic burials of Mohgaon (by Mr. Ankush Dahat) and even economic aspect of North Vindhyan Chalcolithic Culture (Mr. Mukesh Kumar Varma) are interesting papers of their fields. The wood carving gradually takes its shape in stone and metal and presents a magnificent universe of multiple art objects. For Indian thinking; creation of an art object is like worship of God and when it is an art object like an idol of God or Goddess; the sculptor goes through a deep sense of responsibility as he is travelling through the emotions, beliefs and faiths of masses who are going to worship the idol and strongly believe that God/Goddess is actually present in that image, who is hearing all pains, miseries and desires and is going to remove or fulfill that accordingly. This transformation of wood and stone into a God/Goddess is well described by Dr. Anjana Singh & Dr. Arvind Singh, Ms. Aparajita Morde and Dr. Manoj Kumar. When it is an issue of religion and its philosophical representation Buddha and Buddhism is an unending way to go. Every time a new thinking, treatment and philosophy occurs. A simple bowl or pot in Lord Buddha's hands can creat tremendous curiosity and hypothesis which is wisely presented by Mr. Wim Borsboom. The monasteries and nunneries provide ample space to study their architecture and the motives and thinkings behind their construction which are well studied by Dr. Pallavi Nalawde Jambhale. Religion for Indians is a phenomenal part and parcel of nature. So; the river, the mountain, the air, the earth, the sky, the sun and the moon, the animal, bird and reptile or to say each and every creation of God AImighty is also a god and is revered with full faith and gesture. River Ganga is the holyest river of all and is revered as Mother Supreme. Dr. Vijay Pal Singh narrates forms of Ganga found in Puranas. The impact of Toba on Hominin Demography in India (by Mr. Arun Kumar) and The Whirlwind is the Ghost Dancing (by Mr. Alan P. Garfinkel) are very interesting papers. The area of numismatics is well covered by Dr. Rajesh Kannaujia and Dr. Mukesh Sharma. Any society has a long tradition of its rituals all over the world. Mr. Norman Simms creats Ritual Memories in Tribal Dance, Folkplay and Travel Writing which may have its roots down to the rock arts. Mr. Praveen C K has given a preliminary study of recently discovered rock art sites in Kerala.

The great art historian Dr. Daljeet Kaur has given a picturesque presentation of Lord Shiva and his benevolent consort Goddess Parvati in a short but fruitful note proving it as "*gagar*

mein sagar"; through the mediums of art like sculptures and miniature paintings. The other issue taken by Dr. Manuel Joseph as a study of Lakshmi or Mother Goddess or Lajjagauri in context of Bhudevi is thought provoking.

While this issue is in press, we have this great news coming from Sanauli. There are evidences of a rich and royal culture; but of Mahabharata or of Haraapan period is still under discussion. We have a theoretical information and observations about the recent excavation of Sanauli by Dr. Sachin Kr. Tiwary. It will definitely enlighten you and will make you aware and curious about the glorious past of India.

We welcome Dr. Ashok Kumar Singh and Dr. Ajit Kumar as Guest Editors of Arnava. The learned scholars of Dept. of AIHC & Archaeology, Banaras Hindu University, Varanasi and University of Kerala respectively; have long experience of field archaeology and many papers and books to their credit. Dr. Singh and Dr. Kumar will definitely help Arnava in reaching new heights.

We are taking expert opinions of other scholars of various fields in selections and recommendations of papers also. In this regard we would like to thank Prof. Prabash Sahu, Associate Professor, Dept. of AIHC and Archaeology, Nagpur University for his supportive gesture.

We thank all authors who took lot of interest and pain in sparing time and collecting data for new researches and contributing their work in form of papers and articles for this issue. The ideas, opinions and the contents along with line drawings, maps, figures, tables, photographs etc. related with the article or paper are solely of the concerned author and it is not always necessary that editors also agree with that or are of same opinion. So they are not responsible for this in any way or the other.

The research papers and articles are refereed by scholarly Guest Editors. We owe our heartfelt gratitude towards them. We owe our humble thanks to each and every person, who inspire us in some or the other way to move on and on.

As always, your sincere comments, compliments, advices and wishes are welcomed.

Paleolithic Tools in Nagpur : Recent Discovery

Abstract

The Eastern part of Maharashtra, known as Vidarbha, earlier a part of the Central and Berar provinces, related to the Paleolithic culture and tools crafted by proto-humans that have been dated back to two million years; have been discovered and excavated. The site is knows as Papamiya–Tekdi - (79° 18' 54"E; 19°57'13"N) in Chandrapur Dist. and was excavated by L. K. Srinivasan, S. N. Raghunath, B.R. Mani, S.B. Ota (IAR 1960-61, 1961-62, 1976-77, 1986-87, 1993-94, 1994-95). This paper deals with the recent findings of Paleolithic tools from Nagpur City. Preliminary comparative studies carried out with other known excavated and explored Paleolithic sites in Vidarbha such as Papamiya-Tekdi, Wardha – Wainganga basin, Jhari-Mangml and Bhadga nullah

Keywords: Acheulian, Blade, Borer, Cleaver, Hand Axe, Maharashtra, Nagpur, Paleolithic, Vidharbha

सारांश

महाराष्ट्र का पश्चिमी भाग जो विदर्भ के नाम से जाना जाता है और पहले मध्य बरार प्रान्त का एक भाग था, में पुरापाषाण कालीन संस्कृति और उसके उपकरणों से सम्बन्धित स्थल खोज कर उत्खनित किया गया है जिसकी तिथि बीस लाख वर्षों तक पीछे जाती है। यह उत्खनित स्थल पपमिय टेकड़ी (79° 18′ 54 प0; 19° 57′ 13′′ उ0) है जो चन्द्रपुर जिले में है। इसका उत्खनन एल. के. श्रीनिवास, एस. एन. रघुनाथ, बी. आर. मणि, एस. बी. ओता (आई.ए.आर. 1960–61, 1961–62, 1976–77, 1986–87, 1993–94,

* Lecturer, Dept. of AIHC & Archaeology, RTM Nagpur University, Nagpur, Maharashtra

1994–95) द्वारा किया गया। यह शोधपत्र नागपुर शहर से हाल में प्राप्त पुरापाषाण कालीन उपकरणों पर आधारित है। इसका अन्य उत्खनित या सर्वेक्षित पुरापाषाण कालीन स्थलों से तुलनात्मक अध्ययन भी किया गया है जो विदर्भ में स्थित हैं; जैसे पपमिय टेकड़ी, वर्धा–वैनगंगा बेसिन, झरी–मंगमल और भड्गा नाला आदि।

Introduction

Paleolithic Culture

The discovery of first Paleolithic site in India was made by Robert Bruce Foote at Pallavaram near Madras in Tamil Nadu. It was an Acheulian hand axe which was recovered from the detrital lateritic gravel deposit.

The Paleolithic research in India since then is more than 130 years old. Noteworthy developments in the Paleolithic studies began only from 1950 onward of different cultural stages including Maharashtra.

Geomorphology of Maharashtra

The Deccan Upland (15° to 20° N; 74° to 76° E) covers south central Maharashtra, landscape is dominantly erosional. The rolling Upland Plateau developed over an ancient and relatively stable Precambrian and Cambrian metamorphic rocks like gneiss, schist, quartzite and Deccan Trap basalts of the Cretaceous Eocene age. The southern part of the area is the tri-junction of Archaeans, Kaladgis and Deccan Trap rocks. The region is labeled as semi-arid, with the annual rainfall varying from 1000 mm to 400 mm and is largely covered by dry deciduous / thorn and scrub forests. Landscape is characterized by pediments with in selbergs, tors and broad box-shaped valleys drained by autochthonous and allochthonous channels with highly seasonal discharge. The bedrock channels are ungraded as marked by presence of the prominent knick points almost up to their confluence with trunk

streams. Significant erosional features of the Upland Rivers are in the form of waterfalls, incised meanders and deep coalesced potholes. The foot slopes of the pediment scarps and the banks of bedrock streams are covered with regolith consisting of laterite, vertisols and colluvio-alluvial deposits. It has two major drainage systems. The first is the allochthonous drainage of the rivers Godavari, Bhima and Krishna which have catchments in humid Sahyadri mountain range. The second system, comprising the drainage of the Karha, Sina, Manjra, Hunsgi and Baichbal valleys, is autochthonous having catchments in eastern semi-arid plateau.

Geomorphology of Vidharbha with reference to Nagpur District

Major Physiographic unit: -	Three; Northern hilly area, Western hilly area and Kanhan & Wena river valley area
Major Drainage: -	Two; Wardha and Waingangā
Soil Type: -	Medium to deep clayey, black cotton soils; medium, loamy alluvial soils; shallow sandy, clayey red soils.

Geology:-

Recent: -	Alluvium
Upper Cretaceous – Lower Eocene: -	Deccan Trap Basalt
Cretaceous: -	Lameta
Permian to Carboniferous: -	Gondwana
Archaean: -	Crystalline Rocks

Hydrogeology: - Water Bearing Formation - Archaean- Weathered and fractured Granite Gneiss, Gondwana- Kamptee and Barakar Sandstone, Trap covered Gondwana; Deccan Trap- Weathered/Fractured /Jointed Massive or Vesicular Basalt; Alluvium- Sand and Gravel

Geomorphologic Features

The district forms part of Deccan Plateau having flat topped and terraced features. Eastward and northeastwards the landscape changes

due to the change in the underlying rocks. The rocks of Gondwana series are low rolling in topography with a poor soil cover and vegetation. On the north the upland ranges are the extension of Satpuras gradually narrowing down towards west. South of this upland range are the Ambegad hills, the western extremity is the Nagpur district. The Ramtek temple is on the spur of this range. The Girad hill range extends along the southeast separating the valley of the Kar from that of Jamb upto Kondhali. Another hill range runs northwards through Katol taluka from Kondhali to Kelod separating the Wardha and Waingangā valleys. The northeastern and east central parts of the district are drained by the Waingangā and its tributaries. The central and western portion is drained by the Wena which is a tributary of Wardha River.

Soil types in the district - Kali soils or the black cotton soils which are fine grained clayey in texture and varies in depth from 1 m to 6 m or more and retain moisture found around Kalmeshwar, Saoner and Nagpur. Morand soils predominant in the district are black cotton soils with higher percentage of lime. Khardi soils they are mixed with sand and found mainly in hills grey in color, clay loam in texture. Bardi soils red gravel covered with boulders found on summits and slopes of trap hills and are less fertile in nature. Kachchar soils mainly found in the banks of Kanhan River and are alluvial soils, loamy in nature and vary in depth from 1 to 3 m. Wardi soils red soils with a large amount of sand, shallower and clayey loam in nature and mainly found in the paddy tracts of eastern part of the district.

Geography & Topography

Nagpur is located at the exact centre of the Indian peninsula.

It has the Zero Mile Stone locating the geographical centre of India, was used by the British to measure all distances within the Indian subcontinent.

The city lies on the Deccan plateau of the Indian Peninsula and

has a mean altitude of 310.5 meters above sea level. The underlying rock strata are covered with alluvial deposits resulting from the flood plain of the Kanhan River. In some places these give rise to granular sandy soil. In low-lying areas, which are poorly drained, the soil is alluvial clay with poor permeability characteristics. In the eastern part of the city, crystalline metamorphic rocks such as gneiss, schist and granites are found, while in the northern part yellowish sand stones and clays of the lower Gondwana formations are found. Nagpur city is dotted with natural and artificial lakes. The largest lake is Ambazari Lake. Other natural lakes include Gorewada Lake and Telangkhedi Lake. Sonegaon and Gandhisagar Lakes are artificial, created by the city's historical rulers. Nag River, Pilli Nadi, and nallas form the natural drainage pattern for the city.

Palaeolithic Sites in Maharashtra

Kandivali provided a succession of lithic industry with a long sequence of stratigraphic succession in a thin (12 feet) deposit belonging to a single period. Tools of similar types were first found at Nevasa in well-stratified gravels, termed as 'Nevasaian' they have now been found in several river valleys in the Deccan, which consist of scrapers, points, borers, flakes and cores on jasper, chert, agate or chalcedony normally, and in largest number, occurring *in situ,*

At **Kalegaon**, a large number of these tools were found. From Nevasa, Bel-Pandhari and Kalegaon and from the sites on the Tapi (Khandesh) and on the Ghataprabha-Karnatak-nearly 2,000 specimens of the following type Points – Simple and Tanged, Scrapers – Side and End, Borers, Scrapers-Borers were found.

Morgaon artifacts were found in an alluvial deposit thereby indicating the riverine nature of the site. Bori Acheulian site was discovered in the tephra bed. Chirki-on-Pravara on a low order feeder of the River Pravara, 6 km downstream of Nevasa locality.

Konkan cave occupation at Susrondi in Palshet near Guhagar, tools were found, The material is fine-grained and has typical conchoidal fracture. The artifacts are extremely fresh with clear flake-scars and betray razor-sharp margins. Ovate-group of hand axes small in size, symmetrical and broad, Cleavers, Picks, Choppers and Scrapers.

Palaeolithic Sites in Vidharbha

Papamiya–Tekdi - (79° 18' 54"E; 19°57'13"N) Shri L. K. Srinivasan of the South-eastern Circle of the Survey discovered a number of prehistoric sites in the basins of the Wardha and Waingangā rivers. One of them is near Papamiya-Tekdi, 5 kilometres north-east of the Chanda town. Here bifacial pebble choppers and Abbevilleo-Acheulian hand axes and cleavers were picked up from the exposed gravel-beds of the Jharpat. Similar tools were also found *in situ*, in a rubble-conglomerate bed in a left-bank section of the same river, from the uppermost gravel, overlying a thick deposit of silt, were picked up scrapers, borers and diminutive axes, ascribable to an early stage of Series II. One of diminutive axes, worked on a pebble, is particularly noteworthy. Blades, scrapers, burins, awls, etc., representing a blade-and burin industry. The Palaeolithic industry comprised both heavy and light duty tools including choppers both unifacial and bifacial, hand axes, cleavers, picks, scrapers, etc., mostly fabricated on locally available shale, and a few on coarse grained sandstone and fine-grained quartzite. A pounder of coarse-grained sandstone, pieces of silicified wood of which one bears slight working. Succession of lithic industries was noticed at Jhari-Mangml also, on the Bhadga nullah in the Waingangā basin, where bifacial pebble choppers and Abbevilleo-Acheulian hand axes and cleavers were found. On the surface of the topmost reddened gravel tools of Series II as well as of the blade-and-burin industry included, also diminutive axes worked on quartzite and silicious stones were found.

Continuing his work Shri L. K. Srinivasan explored the Jharpat

river-valley to the east of the town of Chanda. A number of unifacial pebble tools along with bifacial hand axes and cleavers were collected. Typical specimens of the blade-burin industry were also found in the locality. Of unusual interest was a giant lunate-like half-ovate made on a big lump of jasper with the arc-side carefully trimmed and showing flake-scars. Extending his exploration Shri Srinivasan discovered a number of sites yielding Early Stone Age chopper-chopping pebble tools, a few of them actually showing lateritic stains. Shri S. N. Raghunath of the Survey discovered two more localities, yielding flake tools, mostly cleavers and smaller blade elements showing techno-typological development. Shri B.R. Mani of the Aurangabad Circle of the Survey discovered a wood fossil and a large quantity of stone tools.

The Prehistory Branch, Nagpur, of the Survey under the direction of S.B. Ota, carried out geo-archaeological investigations to ascertain the stratigraphical position of various successive Stone Age cultural remains

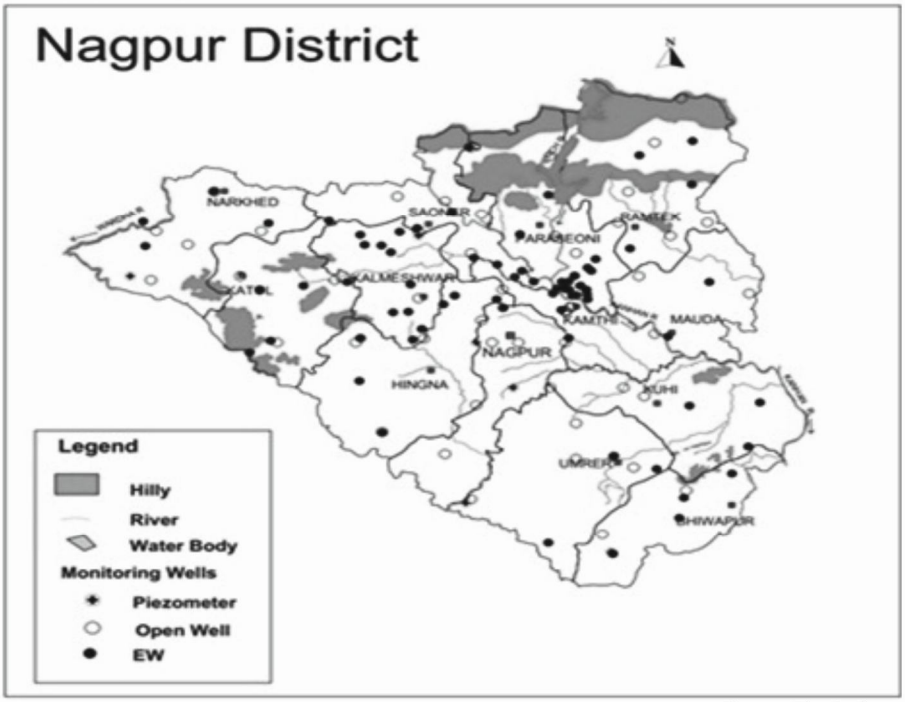

Fig. 1: Discovery of Paleolithic Tools from Nagpur City Figures: The Author

as described by L.K. Srinivasan, the main concentration of artefacts was noticed on the right bank of the *nullah,* which include choppers both unifacial and bifacial, hand axes, cleavers, picks, scrapers, etc, fabricated on locally available shale, a few on coarse grained sandstone and fine-grained quartzite. The observations suggest that the assemblage belongs to the late Acheulian cultural phase. It is mainly a habitation site where tools were also manufactured.

{Papamiya-Tekdi Chandrapur 150 Kms SW of Nagpur City (IAR 1960-61, 1961-62, 1976-77, 1986-87, 1993-94, 1994-95)}

Discovery of Palaeolithic Tools from Nagpur City

On 26th Nov 1993 while visiting a friend house in Nandanvan Colony, Nagpur – 440009, Maharashtra State [21.1458°N, 79.0882°E], 6 kms. from Zero Milestone south of NH-6(Nagpur-Raipur-Kolkata Highway), stumbled upon heaps of mud (Black Cotton Soil) which came

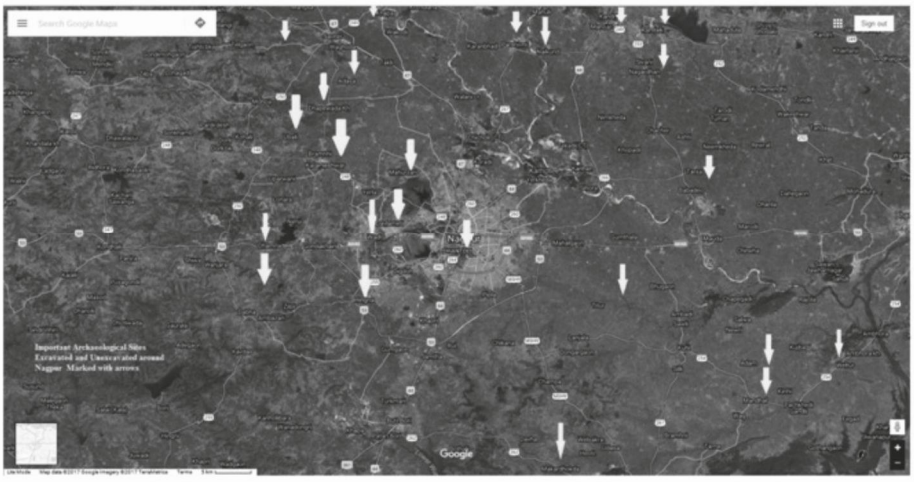

Fig. 2: Google Earth Map : Important Archaeological Sites Excavated and Unexcavated around Nagpur City-Marked with pointer

out during digging of well at the premises of house, on closer examination of the soil and its contents Researcher made startling discovery of Paleolithic tool hoard, of which the most outstanding being a Hand Axe, and a Cleaver with Acheulian affinity along with blades and

borers of different size and shape, in mint condition. On further enquiry it was revealed that artifacts came from 6.5mtr below ground level

The area which is now called Nandanvan colony was marked as Forested Wet Land with black cotton soil in the records/maps of Survey of India (East India Company, *circa* 1800) with perennial rivers flowing west to east having tributaries north and south, evidence of which is still found in form of Nag River and its tributaries which got narrowed down to a sewage canal due to rampant habitation and construction activity. Surveying Nearby area and open ground in central part of Nandanvan Colony residential complex yielded raw material and cores of various sizes.

Fig. 3: Location of Site within Nagpur City – Nandanvan Colony
East Nagpur 6 Kms. from Zero Miles

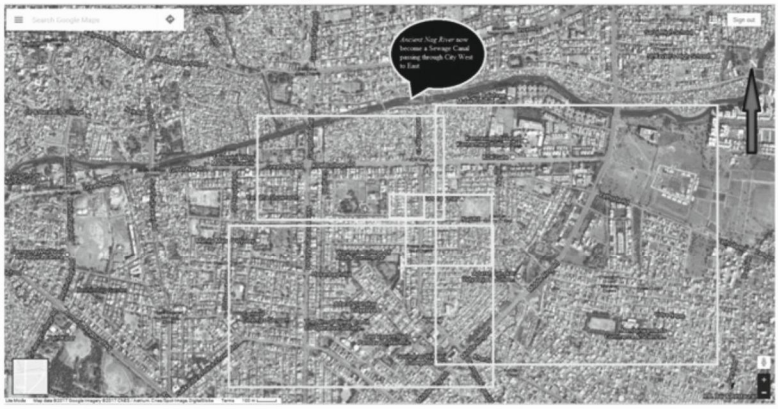

Fig. 4: Google Earth Map

The findings/discovery clearly indicate a flourishing hand axe cleaver industry / Culture of prehistoric times along with presence of man in the central Indian plains particularly in the Nagpur city –Vidharbha Region of 2nd capital of present Maharashtra State (Previously capital of CP & Berar Province).

Details of Tools Discovered

Type: Hand Axe – Unifacial **Material:** Chert

Feature:

Length – 11cms end to end Breadth – 5.7cms end to end

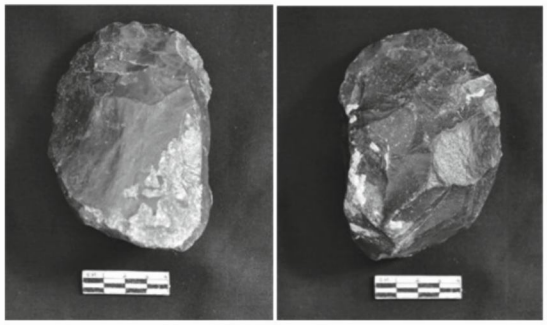

Shape – Almond

Fig. 4: Hand Axe of Chert

Method of Manufacturing:

Cylinder-hammer technique, unifacial on flake where the ventral surface is completely un-touched, some flake-scars are seen on the dorsal surface. Flake-scars are uniform in shape and size but smaller, shallow and regular. Retouching done on the edges showing a prominent ridge as mid rib on one surface but not continuous or straight to form a unbroken line. There is a marked negative bulb of percussion; butt end is not heavy but symmetrical

Type: Cleaver – Bifacial
Material: Chert
Feature: Length – 10.2cms
end to end
Breadth – 7.5cms
end to end
Shape – Pear

Fig. 5: Bifacial Cleaver of Chert

Method of Manufacturing:

Bifacial on core with straight cutting edge having thick butt, both the surfaces worked using cylinder hammer technique. Flake scars have uniformity in shape and size; shallow and regular, with retouching on edges.

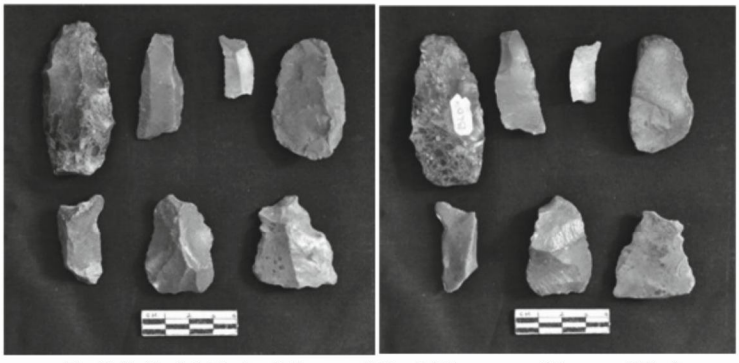

Fig. 6: Unifacial Blades & Borers of Chert (Obverse and Reverse Sides)

Type: Blade – Unifacial

Material: Chert

Feature: Length – Ranging from 4cms to 6.1cms

Breadth – 3cms end to end

Method of Manufacturing:

Parallel flaking technique, unifacial on flake, long and thing having two parallel flake scars on one side and single scar on other side, length exceeds twice the breadth. Another is long thin parallel sided flake.

Type: Borer – Unifacial

Material: Chert

Feature: Length – Ranging from 2.5cms to 3.9cms

Breadth – 1cms to 2cms

Method of Manufacturing:

Also known as Awl, pressure flaking technique, unifacial on flake by making deep notches one on each side to form a narrow but stout projecting point, which is sharpened by careful and minute retouches. Beaked edged graver, more than one curved graver facet meets with a concave flake scar to form a gouge edge or with a flat plain flake scar to from a nose like beaked edge.

Chronology of Paleolithic Culture in Maharashtra

- Members of the British Archaeological Mission to Pakistan have reported three hand axes from two localities in the Rawalpindi area of the Siwaliks which are dated to between 700,000 and 400,000 years on the basis of magnetic polarity Stratigraphy (Dennell and Rendell 1988; 98-106).
- Volcanic ash associated with Acheulian tools at Bori in Maharashtra has been dated by potassium argon method but the dates ranging from 1.4 myr to 75,000 years.
- Application of Th230/U234 and thermoluminiscence techniques to

Acheulian sites of Umrethi in Saurashtra (Marathe 1981) and 16R locality at Didwana in Rajasthan (Misra and Rajaguru 1986; Raghavan et. al. 1989) has given dates ranging from 390,000 years to 150,000 years.

- Th230/U234 dates obtained on travertine from Kaldevanhalli and on Elephas molar from Sadab and Elephas and Bos molars from Tegehalli in the Hunsgi-Baichbal valleys in Karnataka range from 350,000 to 166,000 B.P.
- Dates obtained on calcrete from the Acheulian site of Nevasa in Maharashtra and Yedurwadi in Karnataka are more than 350,000 B.P. (Mishra 1992).

The genetic relationship between the Nevasaian and the Acheulian phase of the Chelles-Acheul culture of the region is well manifested both stratigraphically and technologically, and it's concluded that Nevasaian is a derivative of the Acheulian culture. But for the difference in the raw material and presence of tool types like simple and tanged (recalling Aterian tanged points) points, borers and a few flake blades this industry could have been mistaken for a by-product of the Acheulian Industries.

Tools of Kalegaon belonged to the Middle Pleistocene period. The gravels and the associated tools have to be dated Middle-Late Pleistocene. Which are fully in conformity with the nature, type and technique of the tool, the Konkan cave sediments bring to light Stratigraphy and contemporary palaeo environment, the cave was occupied by early man during the early Late Pleistocene (approximately earlier than 90 Ka BP) when the sea level was slightly higher than that today. As seen by the lower fine-grained mottled clay (about 80 cm thick).

The antiquity of the lower Paleolithic will go back to the lower Pleistocene i.e. between 2.0 and 0.7 million years. At many sites the

Acheulian grades into the middle Paleolithic and since the absolute dates of the middle Paleolithic sites range from ca. 150,000 to ca. 20,000 B.P., it is quite likely that the Acheulian tradition persisted, at least in some areas, well into the upper Pleistocene. A hominid cranium (around 200,000 years old) has been discovered in the Acheulian bearing gravels of the Narmada River at Hathnora in Madhya Pradesh. This cranium represents an advanced stage of Homo erectus or early stage of Homo sapiens (Henry de Lumley and Sonakia 1985; M A de Lumley and Sonakia 1985; Kennedy and Chiment 1991).

The Palaeolithic Age in India is divided into three phases in accordance with the type of stone tools and according to the nature of climatic change.

The first phase may be placed broadly between 600,000 and 150,000 BC, the second between 150,000 and 35,000 B.C.E., and the third between 35,000 and 10,000 B.C.E. The Early Old Stone Age may have begun in Africa around two million years ago, but in India it is not older than 600,000 years.

Conclusion

After taking references from various Eminent Indian Scholars, Researcher has the following conclusion: -

- The Acheulian hunter-gatherers lived in the open along perennial as well as seasonal streams.
- The present findings clearly indicate the presence of a flourishing factory site in the Nagpur city
- Chronology for the Paleolithic culture in India range from 700,000 to 20,000 B.P as at many sites the Acheulian grades into the middle Paleolithic and Acheulian tradition persisted, at least in some areas, well into the upper Pleistocene.
- Further Investigation may throw welcome light on the Paleolithic Culture in the city of Nagpur.
