In Honour of

PROFESSOR J.N.PAL

PROFESSOR J.N. PAL

Prof. J.N. Pal has been a renowned field archaeologist, pre-historian, proto-historian, paleo-anthropologist, paleo-zoologist, museologist and art critic, who has served more than four decades at Allahabad University, Prayagraj. He has been an alumnus of Institute of Archaeology, Archaeological Survey of India. He has been the Curator of Kausambi Museum (Professor G.R. Sharma, Memorial Museum), Department of Ancient History, Culture and Archaeology, University of Allahabad 1974-1977. He has supervised more than 25 research scholars for PhD work. He has discovered a large number of archaeological sites in Uttar Pradesh during his explorations and has directed more than 16 excavation projects in the country, some of which are Koldihwa (1974), Mahagara (1975,1976), Pachoh (1976),Mahadaha (1978,1979), Damdama (1982 to 1985), Sihawal-I (1980), Baghor (1980 and 1982), Merhauli (1984), Malhar (1985 to 1988), Jhusi (1995, 1998, 1999, 2002, 2003), Amilkoni (1998), Tokwa (2000, 2002-03), Baidha (2001-02), Hetapatti(2004-05) and many more. He has studied the Mesolithic human skeletons from Sarai Nahar Rai and Mahadaha with Prof. K.A.R. Kennedy of Cornell University, Ithaca, U.S.A. in 1980, studied the dental/skeletal remains from Mesolithic sites with Ms. Diane E. Hawkey of Department of Anthropology, Arizona State University, Tempe, Arizona, U.S.A. in 1993, studied the Mesolithic human skeletons from Mahadaha and Damdama with Prof. John R. Lukacs of University of Oregon, Eugene, U.S.A. in 1986, 1991, 2003.

He is member of various national and international organizations in the field and has widely travelled to European and Asian countries in international seminars and conferences. He has more than 15 books and more than 120 research papers to his credit. He is an able administrator, excavator and editor. He has presented more than 140 research papers in National and International Seminars and Conferences.

EDITORIAL

It is known that every issue of ICON-Journal of Archaeology and Culture is published in honour of some commendable scholar. This sixth issue too feels glorious to be published in honour of one such distinguished scholar of Archaeology and famous excavator Prof. Jagannath Pal (J.N. Pal), Department of Ancient History, Culture and Archaeology, Allahabad University, Prayagraj. Professor J.N. Pal is mainly an extremely honoured and most popular scholar of Prehistory. His excellent research work has made his name written in golden letters not only in the country but in foreign nations as well. More paper and ink would be required in describing the novel research works done by Prof. Pal, but still it is important to mention some of his distinguished works – the excavations done at Koldihva (1974), Mahagra (1975,76), Damdama (1982-85), Bagor (1980-82), Jhusi (1995,98,99,2002,2003), Tokwa (2000,02,03), Hettapatti (2004-05) and fourteen other important sites, its reports and has added various new dimensions through an in-depth study in the field of prehistory .

Prof. J.N. Pal is not only a scholar of higher quality but is soft spoken, thoughtful and has rich multidimensional personality. Along with being engrossed in various sections of works his association with this Journal is committed since the commencement of this journal. For this your recommendation and guidance has proved to be great importance in acquiring of knowledge, establishing and making of this Journal of great reputation. Hence the Editorial Board of this ICON through this issue has taken the offence of conferring this honour to him but the fact remains is that this journal itself is getting honour by ascribing the name of Prof. Pal with it.

This ICON is being published since five years. It can be said that this ICON has reached a mark. It has till date, published various Research Papers touching the different aspects of Archaeology and Culture written by renowned scholars of the country and foreign nations having the expertise of corresponding arenas. Hence it was accepted by the intellectuals and was thus successful in establishing its place in the educational world.

The first paper of this Sixth Issue is entitled 'Images of Surya Sarvato Bhadra in Khajuraho Museum: A Study,' is written by famous Archaeologist Rajendra Dehuri, Khajuraho. It has a clear description about the sculpture of Sarvato Bhadra Surya that adorns the Khajuraho Museum. It includes the paper of well renowned ISRO scientist Rajmal Jain, Ahmedabad, entitled 'Reminiscence of lost measures of space and time and their relation to modern science' which presents the description in context to ancient and modern space science in a very scientific way. This will enhance the knowledge of the readers of Archaeology, History, and Philosophy etc. The paper Jains in Pakistan: Demographical Study of Multan with special reference to Jaina Religion belongs to the scholars Muhammad Hammed and Rubiga Abid Bukhar of Punjab, Pakistan. The main focus is given in this paper is given to the Jain Religion in Multan, Pakistan. This is an important source of study for the scholar of Jainism. In his paper 'When Men Meets Medicines: Some Reflection in Ayurveda and Modern Medicine with Epistemological Consequences.' The famous writer Jayanta Bhattacharya, North Dinajpur, has put his thought into writing about his knowledge of Ayurvedicmedicines in Ancient India. The scholarly writing of M.K. Pundhir, Aligarh, 'Shahjahani Burj at

(4) Idols (Puppet)

(5) Kivad / Patadia (Door)

By adding these five parts, the **sanduknuma** (Box) of Kavad is made into a three-dimensional shape. To connect these parts, holes are made as required and all the organs are attached to the main part.

The first part (First page part) of Kavad is the most wide From the first part, the entrance door opens which opens first. The surface of Kavad is visible only when Kavad opens completely. Kavad is constructed in such a way that it can easily stand on the flat surface and can be transported anywhere as per convenience. (Figure-1)

Epilogue

This temple is a very artistic and attractive artwork. Kavad is an example of a solid and durable art that captivates the viewer with just a philosophy. Since there is also devotion in it and at the same time the story goes through it, it becomes more effective. Kavad also adorns homes, temples and museums as an artistic work and wherever there are centers of attraction, Kawad is also a perfect example of wood art. This object, painting, poetry and sculpture are all included.

In this way, it is proved that Kavad is a small temple through which the form, qualities, leela, dham, name, character and ideal of God are seen and heard and through the blacks, devotion is established in the heart of the people. is. In this three-dimensional art, the artist gets an opportunity to showcase his satvik tendencies, art and aesthetic experience. The tradition of rotating kavada is seen in Rajasthan. The reason behind this is that by giving or having a vision of Kavad, it is rewarding and auspicious and inauspicious deeds done by humans become beneficial after the philosophy and reading of Kavad. Since present day Kavad has remained only as a decoration and artistic item. Due to this, its prevalence is less common in common people. Most of the Kavad museums or government offices and people with artistic thinking and artists are seen. In the present society, the tradition of Kavad art has been damaged due to lack of spirit of spirituality and the construction of large and beautiful temples permanently.

Very few people are aware of this art tradition. Even in the artistic world, the importance of this art seems to be diminishing. Kavad is a fine example of art of the people of Rajasthan. But it has no place in the modern education system and curriculum. It is simply read as a story in books, no practical knowledge of it is being given in any art colleges. It is a matter of concern that Kavad, composed of three arts, is not getting a place in the course of arts today. I request the art thinkers and thinkers to do proper publicity for the preservation and development of this art to reach the government and provide support in arranging the training as well as getting the art done.

Revisiting Vidharbha Megalithic Material Culture – Study of some Tools and Implements found from various Excavations in Vidarbha

K.S. Chandra*

Introduction : The entire Vidarbha, especially Eastern part is dotted with Megalithic Iron Age burials (Stone Circles) as well as habitation sites, most of which have been explored, recorded, and excavated from time to time. Lot of scholars have taken up avid interest on this subject and have put forth their views through various publications and research reports. Britishers took special interest in Indian History to understand our culture and social system. In doing so, they unearthed a rich antiquarian heritage, here through unknown to most Indians at that time. They took pains to document their findings in various books, notes and journals, which are still available for reference and cross checking.

Map 1: Vidarbha in Maharashtra with its eleven districts

* Contributory Lecturer, Department of Ancient Indian History, Culture & Archaeology, RTM Nagpur University, Nagpur. Email: kschandra6@gmail.com

Vidarbha

Vidarbha consists of eleven eastern most districts of Maharashtra state, viz. Buldhana, Akola, Amaravati, Yavatmal, Wardha, Nagpur, Bhandara, Chandrapur, Gadchiroli, Washim and Gondia. Majority of the sites, however, are located in the districts of Nagpur, Wardha and Chandrapur.

After the independence, new researches were, done by the Indian Archaeologists in the field of Megalithic studies. The first Megalithic burial excavation after independence was, carried out by B.K. Thapar in 1960 at the site of Junapani (*IAR 1961-62*:32-33). During sixties of the last century, S.B.Deo started investigation on Megalithic culture of the region. He conducted a series of excavations and explorations, which produced valuable information on typology, technology, material culture, subsistence pattern, settlement system, and ecology and socio-economic life of the Megalithic people of Vidarbha and plotted Vidarbha on the megalithic map of India by his painstaking works. His understanding regarding the use of scientific approach in excavations opened new insights for understanding the megalithic culture. He not only excavated many megalithic sites but also produced their detailed excavation report. He scientifically studied issues regarding the settlement of megalithic community, subsistence pattern, iron smelting, ceramics and technology. He also attempted to place Vidarbha megaliths into chronological framework. Excavations and explorations conducted by Deo, Deglurkar, Lad, Nath and Mohanty along with Nagpur University, Archaeological Survey of India, Deccan College, Maharashtra State Dept Archaeology and Museums, resulted in finding and reporting of more than 100 Megalithic sites in Vidarbha. However, habitation sites belonging to Megalithic culture are less in number compared to burial sites. Only 10 Megalithic habitation sites have been, reported from the region so far and all of them have been, excavated.

Observation

Horse and Horse ornaments :- Ample evidence of Horse and Horse ornaments have been found similar to Viking equipment [Fig. 1] but no horseshoe found and no cart or carriages found this maybe due to environmental conditions of Vidarbha where wood deteriorates faster. Was Horse only used for ceremonial purpose and sacrificed, and then what explains the findings of huge quantities of hoes, how agriculture was carried out, or the hoes were used only for digging wild plants and roots and prey animals from ground.

Comparative Pictorial Analysis

Fig. 1: Horse riding and hunting equipment of Vikings of Jorvik (http://www.bbc.co.uk/schools/primaryhistory/vikings/viking_towns/teachers_resources.shtml)

Fig. 2: Horse Equipment and Iron objects from Junapani & Kamptee (after Leshnik 1970)

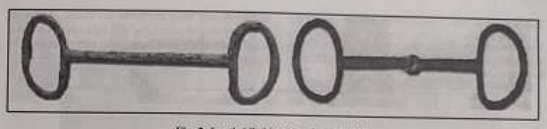

Fig. 3: Iron bridle bits (Katade 2017: 117)

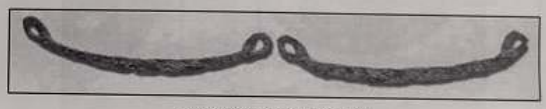

Fig 4: Iron Stirrups (Katade 2017: 118)

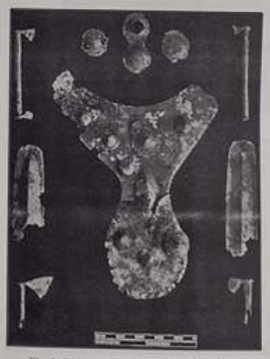

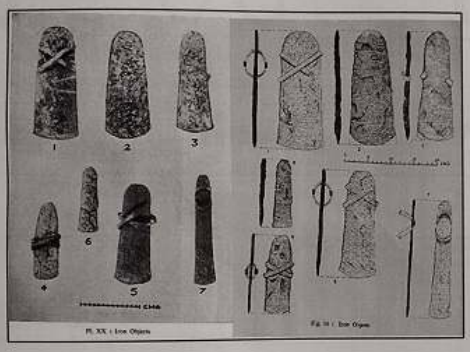

Fig. 5: Copper ornaments of a horse from Khapa (Katade 2017: 111)

Fig. 6: Copper ornaments of a horse (reconstructed) (Katade 2017: 110)

Tools

Axes and Adzes: - Heavy axes have been, found which are mostly used for cutting and felling trees along with that wood saw is nowhere to be seen either due to thin metal structure being eroded in due course of time or wood was shaped using heavy and light adzes. Thin and small adzes might have been, used with short straight handle for leather processing.

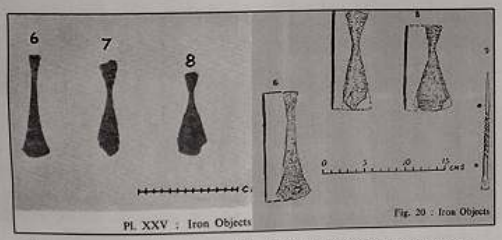

Fig. 7: Axes and Adzes of different shapes and sizes (S.B.Deo, 1973: Pl XX & XXV, Fig.16 & 20)

Fig. 8: Hafted Axe with wooden handle passing through cross ring fastners (pictorial reconstruction by author K.S.Chandra)

Fig.9: Iron Age Adze Hafted (reconstructed) (https://www.tapatalk.com/groups/palcoplanet69529/who-uses-adzes-let-s-see-them-t7822.html)

Chisels: Sites have yielded chisels but absence of hammer is a mystery, most of the chisels might, have been, used in stone cutting, as their make is, heavy and use of heat cutting method might have eliminated the need for using Hammer, which consumed much of metal to make.

Fig. 10: Chisels of different size and shapes from Mahurjhari (Virag.G.Sontakke: Fig 14; pg.120)

Stone Net Sinkers: - Might have been, used as flywheel for fire drill, pump drill, a weight or cup stone for crank drill [Fig. 11]

Comparative Pictorial Analysis

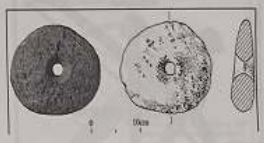

Fig. 11: A ground stone-perforated disk, which is a possible flywheel for a pump drill or a weight for a crank drill, from Tel Dhan Locus 8189 (stratum V [Iron Age]) (https://www.researchgate.net/figure/A-ground-stone-perforated-disk-which-is-a-possible-flywheel-for-a-pump-drill-or-a-weight_fig5_309040342)

Drill and Drill bits: - The so-called Nail Parer by scholars and excavators [Fig. 12] might have been, used as drill bits for wood / stone and leather working [Fig. 13]

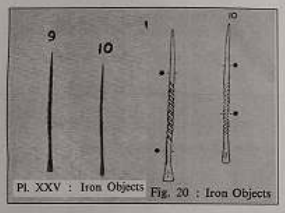

Fig. 12: Nail Parers from Mahurjhari (S.B.Deo, 1973: Pl XXV & Fig.20)

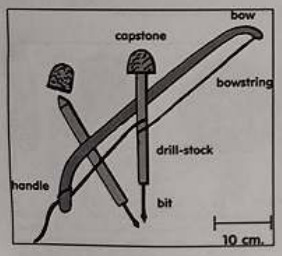

Fig. 13: Bow Drill for Woodworking or stone drilling with flat drill bit for making uniform hole (http://journals.ed.ac.uk/lithicstudies/article/view/1642/2305)

As of now complete or fragments of bow drill or drilling instrument has not been, found from any site, we may expect a find in future excavations.

Fig. 14: Nail parer (Source National Museum of American History)

The bow drill possessed two advantages over the strap drill

1. The shaft would be, rotated at a higher speed
2. Only one hand was, needed to handle the bow.

Typical usage scenario of Pump and Bow drills in ancient times

- Fire Making
- Stone Drilling
- Bead Drilling
- Wood Drilling
- Piercing Leather
- Dentistry
- Bone Drilling

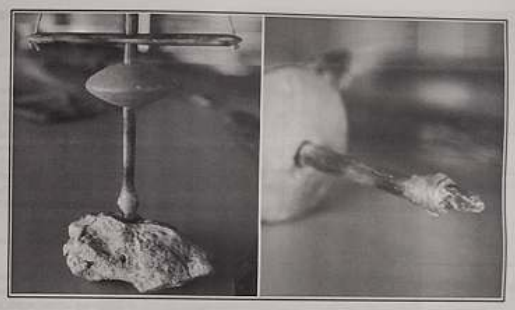

Fig.15: Stone drilling Hand drill found at ancient archeological site in turkey with flywheel similar to spindle whorl (Michael Orosz, 2017, https://www.look4sword.co.uk/archeology/7-500-year-old-hand-drill-found-at-ancient-archeological-site-in-turkey/)

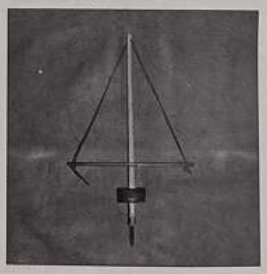

Fig.16: Early Pump Drill with stone flywheel (http://paleotool.wordpress.com)

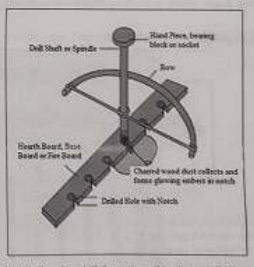

Fig. 17: Bow Fire drill (https://en.wikipedia.org/wiki/Bow_drill)

Fig.18: Modern Woodworking drill (https://sites.google.com/a/v.sonao.net/a618/6pcs-Hex-Shank-Wood-Flat-Drill-Bits-Sets-Woodworking-Spade-Drilling-Power-Tools-Hole-Saw-10mm)

Weapons: - Weapons of offence like Copper hilted Iron dagger similar to Scythian affinity and battle-axe (*Parshu*) are, found. However, absence of weapons of defense like Shield is intriguing.

Comment of Rev. Hislop on the excavated material:

'With reference to these remains I may state that the vestiges of an ancient Scythian raid in this part of India are very numerous. They are found chiefly as barrows, surrounded with a circle of stones, which when complete are styled Kistvaens, and when open on one side, cromlechs. The cromlechs are, now found empty. The Kistvaens, if they have been disturbed, contain stone coffins, urns, etc. The tumuli are also rich in antiquities.' (Hislop1857, JBBRAS: 671-72).

Henry Cousens *(1892-94) mention about stone circle is interesting:*

'These circles are of great age. No one can now say exactly what they are but it is, believed that they mark the site of temporary encampments of the Gavalis, or pastoral tribes who wandered from place to place with their cattle. Others say that such places were, used for interring dead bodies. Sometime iron nails and tools are, found beneath the stones. Possibly, they are of Scythian origin.'

Comparative Pictorial Analysis

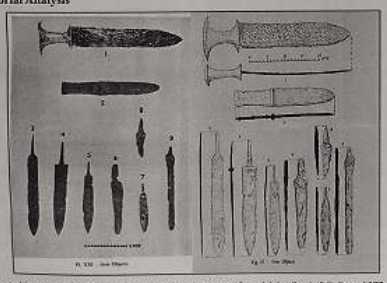

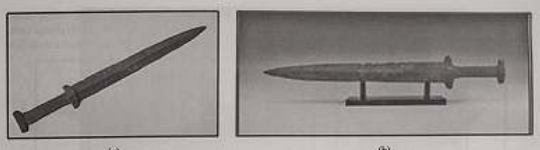

Fig.19: Iron Dagger with copper hilt (1) and different types of Daggers from Maharjhari (S.B.Deo, 1973: Pl XXI & Fig.17)

(a) (b)

Fig. 20: A-Iron Dagger Short Sword Acinaces Early Iron Age Scythian 1st Cent BCE – 1st Cent CE B- Scythian Acinaces Dagger 6th-5th century BCE, iron dagger with broad leaf-shaped blade, rectangular grip with notch (source EBay)

Fig. 21: Scythian Iron Dagger End of VI-Beginning of V Century B.C.E (https://ancienttouch.com/scythian%20arms%20.htm)

[Fig. 21] Iron blade and hilt forged as one piece. Butterfly guard and bar-shaped pommel are, separately made. Wide short blade with mid-rib having slight convex edge, Trapezium shape flat grip, rectangular in cross-section with slightly raised longer sides.

Fig. 22: Egyptian Dagger 1190 BCE during the Reign of Ramses III (Casson 1969: 65)

Spikes, Spears and Arrows: Spikes completely made out of iron have been, recovered in large numbers from sites; probable usage must have been hunting game animals or weapon of offence used from horseback in medium distance attack. Spears with hafting must have been, used along with straight wood with leather or vines used for tying for close combat or killing a larger slow moving animal for food. Arrowheads small to large sizes have been, found in large numbers, which suggest that these people were using bow and arrow for hunt as well as for offence and defense. Absence of Bow again suggests the deterioration of Bow wood and Bow String due to environmental conditions.

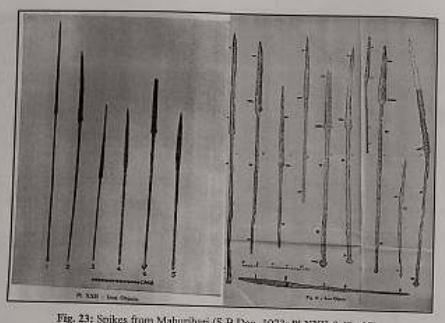

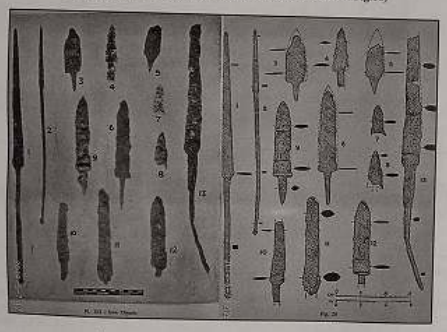

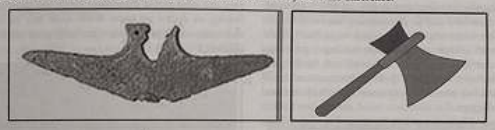

Fig. 23: Spikes from Mahurjhari (S.B.Deo, 1973: Pl XXII & Fig.18)

A B

Fig. 24: A & B – Spikes, Spears (1, 2, 4 & 6) and Arrow Heads (3, 5, 7 & 8) from Takalghat and Khapa (S.B.Deo, 1968-69: Plate XII & Fig.24)

Battle Axe:- The Battle Axe (*Parshu*) made out of thin iron sheet and very sharp at working end are found from some sites is either ceremonial or was extensively used for close combat as the fabric and material can only be used to disable a human and not any animal due to the skeletal and body structure difference.

A B

Fig. 25: A-Battle Axe flat with thin sharp blade edges (Courtesy Deccan college Museum) B- Battle Axe hafted from inside the handle (https://www.colourbox.com/vector/medieval-colorful-logo-emblem-template-flat-style-vector-25438706)

Weapons of Defense

Iron Triple Dagger fragments found from some sites, below are, reconstructed drawing of the same [**Figure 25**] it might have been used as side arm in lieu of shield to stop dagger/spear/spike in close combat.

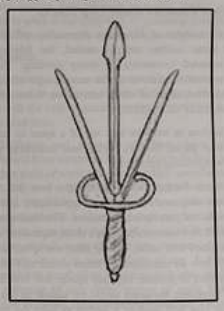

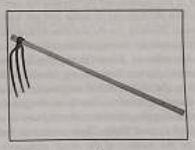

Fig. 26: Probable shape of Iron Triple dagger (https://www.runker.com/list/medieval-weapons/mike-rothschild?page=6) found from some sites

On the other hand, it might be three-pronged fishing spear or three pronged Hoe.

A

B

Fig. 27: A-3 Pronged Fishing Spear (K. David Harrison, 2009), B-3 Pronged Hoe (https://www.drapertools.com/product/17559/3-Prong-Hoe-Fork)

Shield: - Iron shields have not been found in any of the excavated sites until now; (may find in future excavations) assumptions can be made in the favor of wooden shields being used in defense which have not been recovered due to deteriorating nature of wood. Wooden shield round /square/ oval might have, been made with leather strapping for holding / gripping, which were in turn fixed into wood with the help of iron nails or rivets [Fig. 27], these also must have been used in close combat to stop small spears and medium sized daggers.

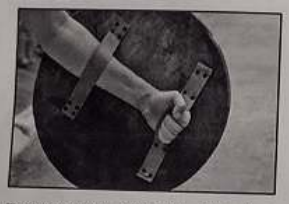

Fig. 28: Reconstruction - Wooden shield with leather handle fixed with iron nails or rivets (https://www.wikihow.com/Make-a-Wooden-Shield)

Other Features

Cup Marks (Cupules)

Rivett Carnac J. H: *'The importance of this was that, it had elaborately highlighted the similarities between the barrows in India and the barrows in Europe. Similarly for the first time he had discussed the 'cup-marks' on megalithic structures in detail. In his memoir, Rivett-Carnac fondly mentions, 'In early days at Nagpore, my friend Mr. Stephen Hislop, the distinguished missionary, had drawn my attention to certain marks on the great stones surrounding the prehistoric tumuli found in several parts of Central India. These are marks hollowed out on the surface of the stone, apparently with some blunt implement. To my amazement, I found markings of almost exactly similar description on some rocks on the moor not far from Alnwick.' (Rivett-Carnac 1879, JRASB XLVIII: 1-16)*

Hunter: *'In Nagpur district one or more stones in most circles are cup-marked. Cup marks are, found abundantly independent of stone circles. [...] To what race and what period these stone circle and cup-marks belong, we do not yet know. While some may go back to remote antiquity, others are probably quite modern.' (Hunter 1933:31)*

Fig. 29: A Peripheral Stone Bearing Cup Marks (Riza Abbas et.al 2010: Pl II d)

Recent Theories about Cup Marks

Careful analysis of these stone depressions will show that these cavities are not natural, but fabricated by repeated hammering or rotary grinding. There are several theories as to the exact usage of these depressions, some of which are, shown below: (Jim Maus, *CSAJ* Vol.55 (2):62)

1. Sockets to hold the butt end of a spear or lance shaft during the bark peeling and smoothing and straightening operations.
2. Anvils for fire making by using a bow drill. A bowstring would have been, wrapped tightly around a shaft to provide rotary motion. The shaft would have then been, anchored in a stone depression and encased with tinder. As the shaft was spun, using the bow for momentum, friction would have been, created to produce heat and sparks and thus fire. Conversely, the stone would be, placed on top of the bow drill shaft as a weight to force the shaft down onto a piece of wood containing the tinder to be ignited

3. Grinding stones to crush minerals and seeds for making paint pigments, crushing of plant materials to make medicines.
4. Nut cracking devices

One, some or all these theories may be correct, during the ancient period most of the Vidarbha flourished with seed and nut bearing trees. These trees produced their fruits, as do all plants, for the purpose of reproduction of the species. Normally in the fall of each year, these seeds or nuts ripen and fall to the ground. Where they could have been, easily picked up and used as a diet staple by the ancient native humans as well as being, eaten by herbivorous animals regardless of individual beliefs as to the uses of these depressions, they were, most likely used to crack nuts a well as to crush seeds, crushing herbs. As more nuts and seeds were cracked and ground into the stones, the individual depressions were, over time, increased in both depth and circumference to the sizes as we find them today.

Today, we call these stones artifacts but to the natives hundreds or thousands of years ago, they were simply another item in their inventive toolkit with which to work at the daily task of gathering enough of Mother Nature's bounty to provide nourishment.

Conclusion

The aim of this paper was to create a hypothesis using the known to unknown theory of reconstructing the past with the help of material evidence available from excavated sites.

Evidence and presence of Horse have been, confirmed from numerous Iron age sites in India as well as other parts of world [Fig. 1] , but other paraphernalia (cart, wagon or cultivation) related to horse is as of now missing, was horse ridden by rider or used for various other purposes is a mystery. Large number of Axes and Adzes does imply that wood was used for making dwelling as well as put to other uses, remains of which are scanty or yet to see the light of day. It can be, assumed that small adzes were used in leather working and shearing of skin from animal to make leather. Coming to chisels, their counterpart hammer is missing from the scene, as discussed heavy chisels might have been, used to carve stone by heat method, light chisels might have been used to carve bone or to make other implements during Iron smelting and implement making. The so called stone net sinkers might have solved dual purpose as net sinker as well as flywheel for wooden drill (remains yet to be found) along with so called nail parers cum tooth picks (S.B.Deo, 1973: 50-51). Toothpicks can be, ruled out, as they are bigger in size compared to a normal toothpick. Nail Parers in such a large number is also intriguing, why so many; it can be assumed that their shape and length might have served the purpose of drill bit in wooden drill for drilling stone, beads, bones and wood as the spiral shape and flat end- drills a smooth and even hole. The dagger with copper hilt seems similar in fabric to that being used by Scythians during the same age as our Vidarbha Megalithic culture, it might have been used in close combat, was there any cultural exchange or interaction needs to be investigated. Weapons of offence are found in plenty, but weapons of defense are scarce, a three-prong item has been found at various sites, which can be assumed as three-prong sword for defense and close combat to stop a large dagger or spear, or it might be a three prong fishing spear or hoe. Shields, which are part of any armory, are yet to be, found; if they were made of wood and leather strapping, which might have diminished due to vagaries of nature. [Fig. 27]

Some scholars theorized Cupules (Cup marks) to astronomical features, which did not gain much provenance. Recent theories and studies have put forward some simple uses of these cup marks such as holder for drill, pounding seeds, sockets to hold wood during making of shafts, to crush minerals for making pigments, to crush herbs for tipping arrows with poisen, or any other use which megalithic man found appropriate. (Jim Maus, *CSAJ* Vol.55, 2:62)

The above discussions have been, formulated by the theory of going from known to unknown where in by observing the present tools and implements and their usage, and going back into past and trying to apply the same with the tools and implements found. Lot of similarities has been, found, their usage also is in line with theories, and assumptions put forth in this paper.

Acknowledgement

My Heartfelt and Sincere thanks to Dr. Preety Trivedi Prof and HOD and, Dr. Prabhas Sahu Associate Prof, Dept of Ancient Indian History Culture and

Archaeology; RTM Nagpur University, Nagpur for their support and motivation in preparing this article. My Sincere Thanks to Ms.Shaila Bhakte for lending me Takalghat & Khapa excavation report, and to Mr. Ankush Dahat for Mahurjhari and Naikund Excavation reports.
